AMENDMENT UNDER 37 C.F.R. § 1.111 Attorney Docket No.: Q86683

Application No.: 10/526,378

the balance being iron and impurities resulting from the production operation of the slab, the microstructure thereof being constituted by ferrite and martensite,

- hot-rolling then cold-rolling the slab in order to produce a sheet,

- heating the sheet at a rate of between 2 and 100°C/s until a holding temperature of between 700 and 900°C is reached,

- cooling the sheet at a rate of between 2 and 100°C/s until a temperature is reached which is close to that of a bath containing molten zinc or a zinc alloy, then

- coating the sheet with zinc or a zinc alloy by means of immersion in the bath and cooling it to ambient temperature at a cooling rate of between 2 and  $100^{\circ}$ C/s.

- 18. (currently amended): Method according to claim 17, characterised in that wherein the sheet is kept at the holding temperature for from 10 to 1000 seconds.
- 19. (currently amended): Method according to claim 17, characterised in that wherein the bath containing molten zinc or a zinc alloy is kept at a temperature of between 450 and 480°C, and in that the immersion time of the sheet is in the order of between 2 and 400 seconds.
- 20. (currently amended): Method according to claim 17, characterised in that wherein the bath principally contains zinc.
- 21. (withdrawn): Use of a very high mechanical strength sheet of steel coated with zinc or zinc alloy, according to claim 16, in the production of automotive components.
